### Education

2015

**PhD in Technical Science, Metrology, Machine Building**, Poznan University of Technology, Poznan.

Also completed several random courses.

2008

**MSc, Eng. in Technical Physics**, Poznan University of Technology, Poznan.

Passed with distinction

### PhD thesis

**title** *Interferometric system for non-tactile shape deviation measurements*

**supervisors** Dr Hab. Eng. Czesław Janusz Jermak

**description** The thesis describes the design and construction of an interferometric system for non-contact shape deviation measurements. This is a new method applied to roundness measurement. An analysis of the state of knowledge of modern methods to measure shape deviations, construction of metrological equipment and development of technical metrology to increase the measurement resolution, was crucial when formulating the goal of this thesis in the following words: The development of an optical, interferometric system for shape deviation measurements with nanometric resolution and precision. After experimental verification of the design and the construction assumptions a system was built: to control a non-contact, non-destructive measurement method; to allow to achieve the shape deviation values (roundness) with much smaller measurement uncertainty compared to contact methods, i.e. with a maximum uncertainty not exceeding a few tenths of nanometers; to enable rapid measurement with a full rotation angle of the object (or with multiple angles of  $2\pi$ ) with a very large number of data points (e.g. 75 points per 1 degree of rotation); with optomechanical components in a modular system, whose configuration and individual components can be replaced, depending on the measurement requirements; using „open source” software to evaluate the measurement data. Comparative measurements were done, to determine the metrological parameters of the system constructed. The principles how to measure with this device were developed, as well as a method to process the data for technical metrological applications. A beta version of the software was written in the C, Octave and Python languages and form a base for further development. The possibility to adapt this device to measure other metrological quantities in an optical, non-contact way is also presented.

### Master thesis

**title** *Interactions of ions with electromagnetic field in the Paul trap with imperfect geometry*

supervisors Dr Gustaw Szawiło  
description In thesis the physical effects concerning the change in the state if ions inside a Paul trap under the influence of an electric field disturbance of a specific shape are presented. The range of changes by disturbances parameters as the vibration amplitude for ions and their frequency was determined numerically. We assumed that there effects are experimentally measurable and the idea was proved that they may be the basis for a single ionic electric field sensor. Moreover, they may be the basis for a sensor of atomic force. The numerical results were experimentally verified on the macroscopic model. Especially the range of change of the vibration amplitude for ions under the influence of a grounded spherical object, was determined. The accuracy of the frequency measurements was verified by means of Fourier transforms without sound optimisation. Finally, a strategy for further experiments was developed and condition for displaying the properties of a surface were determined.

## Achievements

- Polish Physical Society prize for best Master's thesis in Physics (2008)

## Languages

Polish	<b>Native</b>	<i>Mother Tongue</i>
English	<b>Fluent</b>	<i>Daily practice</i>
Russian	<b>Fluent</b>	

## Interests

Activities	Hiking, Trekking, Bushcraft, Camping
Sport	Biking, Swimming
Music	Classic
Science	Non-destructive measurements, optical metrology, quantum optics, physics

## Experience

### Vocational

2011

**Researcher, Assistant, Department of Metrology and Measurement Systems, Poznan University of Technology, Poznan, Poland.**

- Research in optical metrology;
- Construction a new optical systems and interferometers for shape deviation measurements;
- New open-source computer algorithms for metrology data evaluation;
- Non-destructive testing with shearography and laser vibrometry;
- Lectures in metrology, optronics and biomedical engineering.

2008  
2012

**Researcher, National Laboratory of Atomic, Molecular and Optical Physics, Nicolaus Copernicus University, Torun, Poland.**

Ion trap group.

- Experimental investigation of small group of ions trapped in a Paul trap;
- Diode laser stabilization developments;
- CCD camera adjustments;
- Optical setup building;
- Vacuum technology improvements.

## Training

2013

2013

**Apprentice**, *Mechatronika Wyposażenie Dydaktyczne Sp. z o. o.*, Poznań, Poland.

Practice in the company.

- Practice and training in transfer and commercialization of knowledge and intellectual property protection.

## Research stays

2010

2010

**Research stay**, *Quantum Optics and Spectroscopy group, Innsbruck University*, Innsbruck, Austria.

Ion trap group.

- Experiments with cold Calcium ions in the Paul traps;
- Construction of four-channel vacuum cavity for Pound-Dreher-Hall laser stabilization.

**Short visit**, *Quantum Optics and Spectroscopy group, Innsbruck University*, Innsbruck, Austria.

Ion trap group.

- Experiments with cold Calcium ions in the Paul traps;
- Lasers adjustments, wavelength stabilization.

2011

2011

**Research stay**, *Quantum Optics and Spectroscopy group, Innsbruck University*, Innsbruck, Austria.

Ion trap group.

- Experiments with cold Calcium ions in the Paul traps;
- New cavity testing.

## Skills

### Scientific

#### Experimental

Laser optics, Optical instrument design, development and testing, Interferometers construction

#### Theoretical

Optical modelling, both geometrical and physical, Classical and Quantum Optics

### Development

#### Languages

C#, Python, R, Octave, Bash

#### Programs

Comsol Multiphysics, Comsol Script, CAD, Inventor

## Books

2017
